Project Summary

create focus presets, run study sessions, pause or resume them, save completed sessions, and review their study history. The app will use SQLite to store focus presets and session logs, and SharedPreferences for settings such as default duration and motion or sound preferences. It will also include Session Scout, a simple local smart helper that suggests a starting session duration using the user's recent completed sessions. The app will work without cloud services and will include five main screens: dashboard, create/edit preset, focus session

Proposal checkpoint: this document should be detailed enough that an instructor can understand your product direction, architecture intent, and team execution plan before development begins.

#	Proposed Group Member	Student ID	Role / Responsibility	Signed Date
1	Harshit Jain	002916196	UI design, state	10/17/2026
2	Parsh Jadon	002936134	SQLite data laye	10/17/2026
3	Full name	Student ID	UI, data, testing	mm/dd/yyyy

Wireframe Plan Details

allow users to add or update a preset with a label, mood, and duration. The Focus Session screen will allow users to start, pause, resume, finish, and reset a session. The History/Insights screen will show saved session logs, filters, and average session time. The Settings screen will store preferences such as default duration and sound or motion options. Navigation will connect these screens using buttons and clear back actions. The wireframes will also show validation errors, empty history, delete confirmation, and save failure cases. We will ask a
